

Eve OS: The Agentic Business Operating System

AUTOMATE. • INNOVATE. • ELEVATE

Figure 1. AlcreatesAI operating layer hero image.

Document Positioning

This formal whitepaper aligns the product architecture, \$50M financing plan, 10B \$AICA token model, finalized vesting schedule, platform-first strategy, and token/credit utility design into a single investor-ready document.

Version: Final White Edition v17 | Company: AlcreatesAI | Token: \$AICA | Planned Chain: Solana, subject to review

One layer. Many products. Self-improving by design.

Important Notice and Disclaimer

This whitepaper is provided for informational and strategic discussion purposes only. It does not constitute an offer to sell securities, a solicitation to purchase securities or tokens, investment advice, financial advice, legal advice, tax advice, accounting advice, or a guarantee of future performance.

Any private token allocation, SAFT, future token generation event, token distribution, launchpad activity, exchange listing, validator program, staking mechanism, reward mechanism, marketplace mechanism, or related transaction described in this whitepaper is preliminary and subject to legal, regulatory, tax, compliance, accounting, technical, and commercial review.

The \$AICA token, if launched, is intended to function as a utility, access, compute, marketplace, rewards, and coordination token within the AlcreatesAI ecosystem. It is not intended to represent equity ownership, profit rights, dividends, passive income rights, or ownership of AlcreatesAI.

Core Principle

The token is not the product. The platform is the product. The token is designed to become a programmable access, compute, rewards, marketplace, validator, and coordination layer across the AlcreatesAI ecosystem as usage grows.

Table of Contents

- 1. Executive Summary
- 2. The Problem: AI Is Powerful but Fragmented
- 3. Eve OS: The Agentic Business Operating System
- 4. Product Overview: Company in a Box
- 5. Adam, Eve, Jarvis, and Unified Agents
- 6. Desktop-Native and Mobile Operating Experience
- 7. Closed-Loop Quality Engine
- 8. Intelligence and Model Strategy
- 9. Hybrid Compute Infrastructure
- 10. Skills Marketplace and Validator Network
- 11. Token Economy Overview
- 12. \$AICA Tokenomics, Rounds, and Vesting
- 13. Use of Funds and Execution Roadmap
- 14. Business Model and Revenue Streams
- 15. Technical Architecture, Security, and Compliance
- 16. Risks and Mitigations
- 17. Investor Thesis and Conclusion
- Appendices

1. Executive Summary

AlcreatesAI is building Eve OS, an Agentic Business Operating System designed to help entrepreneurs, solopreneurs, small businesses, agencies, and enterprises launch, operate, automate, measure, and scale companies through coordinated AI agents.

The platform is designed around a simple but ambitious idea: every business should be able to access the power of a full AI-powered company without hiring an entire team, mastering dozens of tools, or understanding complex AI infrastructure.

The Thesis

AlcreatesAI is building a product-first intelligence infrastructure company. \$AICA is designed as the programmable utility and coordination layer that can grow around real platform usage.

Core Element	Current Direction
Platform	Eve OS - Agentic Business Operating System
Primary Experience	Native desktop-first application with web and mobile access
Core Product	Company in a Box
Operating Roles	Adam, Eve, Jarvis, and specialized agents
Raise Target	\$50,000,000
Token	\$AICA
Total Supply	10,000,000,000
Private Sale Allocation	22.5% / 2,250,000,000 tokens
Launch FDV	Approximately \$230 million blended launch FDV
Planned Blockchain	Solana SPL token, subject to legal, technical, and strategic review

2. The Problem: AI Is Powerful but Fragmented

Artificial intelligence can write, code, analyze, design, summarize, research, generate media, automate workflows, answer questions, and support decision-making. Yet for most business owners, AI remains difficult to use effectively because tools, data, billing, memory, execution, and quality control remain fragmented.

- Too many tools create context switching and operational friction.
- Too many subscriptions create cost without unified visibility.
- Data lives across CRMs, files, emails, spreadsheets, apps, dashboards, and payment systems.
- Most AI tools lack shared business memory and coordinated execution.
- AI outputs often require manual review, manual routing, and manual implementation.

Figure 2. Fragmented AI tools versus a unified AlcreatesAI operating layer.

3. Eve OS: The Agentic Business Operating System

AlcreatesAI is creating a new category: the Agentic Business Operating System. Eve OS is designed to become a desktop-native, AI-powered operating environment where a user can launch and operate a business through coordinated AI agents, shared memory, secure permissions, credits, workflows, data, compute, and continuous evaluation.

Eve OS is not merely a chatbot, a browser wrapper, a single AI agent, or a developer-only framework. It is intended to be a complete business operating environment that gives users access to agents, tools, data, dashboards, marketplace modules, workflow automation, and token-aware access in one unified system.

Figure 3. Eve OS platform architecture and hybrid compute fabric.

4. Product Overview: Company in a Box

The mass-market expression of Eve OS is Company in a Box. The goal is to help users move from idea to operating business through a guided AI-powered process instead of asking them to understand software stacks, prompts, integrations, automations, infrastructure, and orchestration.

1. Choose a business path or describe a goal.
2. Complete an AI-guided intake interview.
3. Generate strategy, market analysis, positioning, and launch plan.
4. Create brand assets, messaging, offer structure, and content.
5. Configure website, CRM, analytics, email, payments, support, and automation stack.
6. Deploy specialized AI agents.

One layer. Many products. Self-improving by design.

7. Launch core workflows.
8. Monitor, measure, and optimize continuously.

Figure 4. Company in a Box journey from idea to operating business.

5. Adam, Eve, Jarvis, and Unified Agents

AlcreatesAI organizes its intelligence layer around three major roles: Adam, Eve, and Jarvis. Together, they connect into the unified operating core and support both internal operations and customer-facing execution.

Role	Primary Function	Example Responsibilities
Adam	Internal operating intelligence	Admin control, strategic planning, benchmarking, compliance routing, reporting, model evaluation
Eve	Customer-facing concierge	Onboarding, guidance, support, service selection, setup, user experience
Jarvis	Execution workspace	Workflows, app building, task execution, approvals, document generation, code review

Specialized agents may include Strategy, Research, Marketing, Sales, Finance, Legal Operations, Compliance Routing, Coding, Builder, QA, Support, Analytics, Deployment, Data, and Workflow Agents.

Figure 5. Adam, Eve, and Jarvis connected to a unified agent layer.

6. Desktop-Native and Mobile Operating Experience

One of the strongest differentiators of AlcreatesAI is the native desktop strategy. Many AI tools live entirely in a browser. AlcreatesAI is designed around a native desktop application that feels like a serious command center for business operations, while still supporting web and mobile access.

- Native desktop command center for serious workflow execution.
- Department panels for marketing, sales, finance, legal operations, development, support, analytics, and more.
- Wallet, credit, workflow, marketplace, agent, memory, and approval panels.
- Mobile companion access for approvals, alerts, reports, and lightweight execution.

Figure 6. Eve OS desktop command center concept.

One layer. Many products. Self-improving by design.

Figure 7. Eve OS mobile access concepts for approvals, agents, and Company in a Box.

7. Closed-Loop Quality Engine

AlcreatesAI's long-term defensibility depends on quality. Generating outputs is no longer enough. The system must evaluate, improve, test, and learn. The platform is designed around a closed-loop quality model: generate, review, score, improve, deploy, measure, learn, and repeat.

One layer. Many products. Self-improving by design.

- Automated review and benchmark scoring.
- Sandbox validation and code testing.
- Human-in-the-loop review options for sensitive actions.
- Cost, latency, reliability, accuracy, and hallucination scoring.
- Workflow replay and regression testing.

Figure 8. Intelligence growth and benchmarking loop.

8. Intelligence and Model Strategy

AIcreatesAI does not depend on a single model alone. The system combines model routing, specialized agents, memory, tools, workflow execution, evaluation systems, compute infrastructure, user feedback, and proprietary datasets to deliver business outcomes.

The goal is not simply to beat every frontier model at every general task. The disciplined strategy is to become top-tier in specific business execution categories such as coding, app generation, workflow execution, business automation, customer support, marketing operations, sales support, data analytics, document intelligence, compliance routing, benchmarking, and agent coordination.

Truth and Reliability Focus

The model strategy includes source-grounded responses, uncertainty detection, contradiction checking, hallucination scoring, document verification, audit trails, compliance flags, and escalation to human review where required.

9. Hybrid Compute Infrastructure

Compute is central to the AlcreatesAI strategy. Without compute ownership or dedicated compute access, the company remains dependent on third-party APIs, external pricing, external availability, and limited customization. With compute, AlcreatesAI can support model hosting, inference, fine-tuning, benchmarking, synthetic data, code testing, workflow evaluation, proprietary model development, enterprise deployments, validator expansion, and cost optimization.

- Phase 0-1: initial high-performance GPU cluster strategy.
- Phase 2+: approximately \$3.5M+ high-end GPU cluster.
- Long-term: hybrid model combining owned compute, cloud compute, and future validator compute contribution.

Figure 9. Compute economy, GPU contributors, validators, and reward pathways.

10. Skills Marketplace and Validator Network

One layer. Many products. Self-improving by design.

The Skills Marketplace is designed as the App Store for AI business workflows. A Skill may be a reusable AI capability, workflow, template, automation, agent module, app component, data connector, or business process that can be installed or purchased inside Eve OS.

- AlcreatesAI-created Skills for high-value workflows.
- Approved developers, agencies, consultants, and workflow creators.
- Royalties, marketplace fees, certification, and enterprise licensing.
- Future validator participation through compute, data, evaluation, feedback, and quality scoring.

Figure 10. Platform expansion flywheel: more products, users, usage, data, models, utility, and revenue.

11. Token Economy Overview

The \$AICA token is designed as the utility and coordination layer for the AlcreatesAI ecosystem. The token is not designed to replace SaaS revenue. It is designed to enhance the ecosystem as the platform grows.

Mainstream customers should be able to use Eve OS without understanding crypto. They may pay with card, ACH, wire, invoice, or enterprise contract and receive AI credits. Crypto-native users may access tokenized functionality where permitted.

Access Paths: Fiat, Token, and Enterprise

Figure 11. Access paths: fiat, token, and enterprise lanes share the same intelligence layer.

One layer. Many products. Self-improving by design.

12. \$AICA Tokenomics, Rounds, and Vesting

The tokenomics are designed to support a broad ecosystem of users, developers, validators, compute providers, Skills creators, data contributors, enterprise partners, and future products. The structure below is the current working model and remains subject to legal, regulatory, tax, compliance, technical, and commercial review.

Category	Percentage	Tokens	Purpose
Private Sale	22.5%	2,250,000,000	Raise \$50M for compute, product, model development, infrastructure, and go-to-market
Team + Marketing + Operations	15%	1,500,000,000	Team incentives, advisors, marketing, operations, runway, and strategic execution
Liquidity	10%	1,000,000,000	Exchange support, liquidity planning, and market operations subject to controls
Community & Rewards	52.5%	5,250,000,000	GPU validators, data contributors, Skills creators, feedback rewards, workflow rewards, and ecosystem growth
Total	100%	10,000,000,000	Full token supply

TOKENOMICS ALLOCATION

10,000,000,000 total \$AICA supply

22.5%
PRIVATE SALE
2.25B tokens

15%
TEAM + MARKETING + OPS
1.5B tokens

10%
LIQUIDITY
1B tokens

52.5%
COMMUNITY & REWARDS
5.25B tokens

Majority supply is reserved for long-term community, rewards, validators, data, and Skills ecosystem utility.

Figure 13. \$AICA tokenomics allocation: 10B total supply.

Round	Target Raise	Price	Tokens Sold	FDV at Round
Strategic Seed	\$5,000,000	\$0.010	500,000,000	\$100M
Private Round 1	\$12,000,000	\$0.015	800,000,000	\$150M
Private Round 2	\$18,000,000	\$0.020	900,000,000	\$200M
Infrastructure / Strategic	\$10,000,000	\$0.026	384,615,385	\$260M
Community / Launchpad	\$5,000,000	\$0.034	147,058,824	\$340M
Total	\$50,000,000	—	2,250,000,000	~\$230M

Vesting and Cliff Schedule

To promote long-term alignment, reduce early sell pressure, and support a healthier post-launch market structure, \$AICA allocations are subject to round-specific vesting schedules. Earlier investors receive lower pricing and assume greater early-stage risk; therefore, they are subject to longer cliffs and longer vesting periods. Later-stage strategic and community allocations are structured with shorter unlock schedules to reflect their later entry point and ecosystem role.

Round	Cliff	Linear Vesting	Total Lock Period
Strategic Seed	3 months	12 months	15 months
Private Round 1 (P1)	2 months	10 months	12 months
Private Round 2 (P2)	2 months	7 months	9 months
Infrastructure / Strategic	1 month	5 months	6 months
Community / Launchpad	0 months	3 months	3 months

Definition of Cliff

A cliff is the initial period during which no tokens are unlocked or claimable. Once the cliff expires, the allocation begins vesting on a linear schedule over the remaining vesting period.

Private Sale Structure and Vesting

Aligned to the \$50M raise, 22.5% private allocation, and finalized cliff schedule.

Round Structure

Round	Raise	Price	Tokens
Strategic Seed	\$5M	\$0.010	500M
Private Round 1	\$12M	\$0.015	800M
Private Round 2	\$18M	\$0.020	900M
Infrastructure / Strategic	\$10M	\$0.026	384.6M
Community / Launchpad	\$5M	\$0.034	147.1M
Total	\$50M	—	2.25B

Approved Vesting & Cliff Summary

Round	Cliff	Linear Vesting	Total
Strategic Seed	3 months	12 months	15 months
Private Round 1	2 months	10 months	12 months
Private Round 2	2 months	7 months	9 months
Infrastructure / Strategic	1 month	5 months	6 months
Community / Launchpad	0 months	3 months	3 months

Built for alignment.

Earlier investors receive lower prices and accept longer lockups; later rounds receive shorter locks while still reducing immediate post-TGE supply pressure.

Figure 14. Private sale structure, pricing, and finalized vesting schedule.

One layer. Many products. Self-improving by design.

AlcreatesAI

CLOSED-LOOP TOKEN ECONOMY

THE AICA / AlcreatesAI UTILITY ECONOMY

Figure 15. Closed-loop token economy concept. Final implementation is subject to legal, tax, and regulatory review.

13. Use of Funds and Execution Roadmap

AlcreatesAI is raising \$50 million to fund the development and launch of Eve OS, compute infrastructure, model development, token infrastructure, and go-to-market execution.

USE OF FUNDS: \$50M RAISE

	45–50%	AI model development + compute infrastructure \$3.5M+ GPU cluster, inference, fine-tuning, benchmarking, evaluation
	25–30%	Product engineering & platform development Eve OS desktop, web/mobile, agents, Skills Marketplace, credit ledger
	15–20%	Go-to-market, team, and operations Hiring, pilots, partnerships, sales, support, and operations
	10%	Strategic reserve Runway, legal/compliance, infrastructure flexibility, launch readiness

FIGURE 16. USE OF FUNDS FOR THE \$50M RAISE.

EXECUTION ROADMAP

Phased delivery: product value early, then intelligence and ecosystem scale.

Figure 16. Use of funds for the \$50M raise.

Figure 17. AIcreatesAI phased execution roadmap.

One layer. Many products. Self-improving by design.

14. Business Model and Revenue Streams

AlcreatesAI is designed to be revenue-first. The platform can generate revenue before and after token launch through software, credits, enterprise contracts, managed services, marketplace activity, data products, and future product lines.

Revenue Stream	Description
SaaS Subscriptions	Monthly or annual access to Eve OS across starter, professional, agency, business, and enterprise tiers
AI Credits	Usage units for agent runs, workflows, reports, app builds, code review, and premium models
Enterprise Deployments	Private workspaces, department agents, admin controls, dedicated usage pools, security, and reporting
Managed Services	Business launch setup, marketing automation, app building, CRM setup, workflow design
Skills Marketplace	Skill purchases, subscriptions, platform fees, developer revenue share, licensing, and premium listings
Data and Analytics Products	Business intelligence dashboards, market research, forecasts, KPI reports, and future data products

15. Technical Architecture, Security, and Compliance

AlcreatesAI's architecture is designed to support a modular, scalable, secure operating system. The stack includes user interfaces, API services, orchestration, memory, file ingestion, data connectors, marketplace services, validator services, wallet/credit interfaces, compliance routing, and evaluation layers.

- Role-based access control and scoped permissions.
- Encrypted data storage and encrypted transport.
- Wallet verification, transaction limits, and treasury controls.
- Audit logs, sandboxed execution, model safety checks, and approval gates.
- KYC/KYB, jurisdiction controls, source-of-funds review, and SAFT-first investor onboarding where legally appropriate.

Financial and Compliance Boundary

Any financial product features, including wallets, cards, payments, ramps, custody, stablecoin access, treasury tools, or money movement, should be provided only through licensed and compliant infrastructure partners where required. The whitepaper should not imply AlcreatesAI is a bank, broker-dealer, money transmitter, custodian, investment advisor, or exchange unless the company obtains required licenses or uses properly licensed partners.

16. Risks and Mitigations

Risk	Mitigation
Multi-agent coordination complexity	Start narrow, launch reliable workflows first, measure outcomes, and expand autonomy gradually

AI reliability risk	Closed-loop quality control, benchmarking, sandbox testing, human review, and structured evaluation
Token and regulatory risk	SAFT-first structure, qualified counsel, risk disclosures, jurisdiction controls, and utility-first design
Team execution risk	Small high-quality team, phased delivery, measurable milestones, and focused product scope
Compute and infrastructure cost risk	Targeted cluster, cloud bursting, optimized routing, and scaling compute with usage
Adoption risk	Product-first model, fiat access, simple UX, practical workflows, and token utility tied to real usage
Security risk	Audits, RBAC, encryption, sandboxing, treasury controls, wallet limits, monitoring, and incident response

17. Investor Thesis and Conclusion

The investor case is not that AlcreatesAI is launching a token. The investor case is that AlcreatesAI is building a product-first AI infrastructure company with a tokenized access, compute, rewards, and marketplace layer around real platform usage.

- Category creation: the Agentic Business Operating System.
- Product-first strategy: subscriptions, credits, enterprise contracts, managed services, marketplace, data products, and future products.
- Compute and intelligence moat: model hosting, fine-tuning, evaluation, synthetic data, and proprietary model development.
- Closed-loop quality: workflows generate task data, evaluation scores, feedback, and improvement opportunities.
- Tokenized ecosystem: \$AICA coordinates compute, data, Skills, marketplace, validator, and incentive activity.
- Healthy launch structure: approximately \$230M blended launch FDV under the current working model.

AlcreatesAI is building the operating system for the agentic era of business. Eve OS is designed to unify agents, apps, workflows, data, memory, credits, compute, quality control, marketplace modules, validator contributions, and tokenized access into one platform.

Closing Statement

One platform. Many products. Self-improving by design.
